

**ITC report**

# genomic reliability

- simulation in place
  - explanation of inflation of GEBV rel compared to  $r^2$
  - inflation linked with training pop size
  - effect of sel intensity

# gebv val test

- b1 upper limit to 1.2
- scaling of data GEBV red to GEBV full then test the differences in means of specific subgroup between GEBV red and DRP
- preselection : no problem
- top bulls overevaluated? to be analysed
- GEBV to certify nat'l GEBV systems

# post processing

- post processing is still useful
- parameters to be checked
- trait definition is important
- if deviation is substantial important for country to know
